

Digital Temperature Transmitter

with HART® Protocol, Head Mounting

Electrical Temperature Measurement

Model T32.10
Model T32.11

- HART®-Protocol
- Configurable via
 - HART® Communicator
 - Asset Management System
 - e.g. AMS, SIMATIC PDM, SMART Vision
 - User friendly WIKA Configuration Software
- Model T32.11 has increased ambient temperature stability
- Universal transmitter for
 - RTDs/Termocouples
 - Resistance-sensors/mV-sensors
- Output linear to temperature with RTD and thermocouple input signals
- Customer specific linearisation with max. 30 points for sensors with Ω- or mV-output
- Individually configurable signalling for possible errors of the sensor system
- EMC Conformity per DIN EN 61 326-1 NAMUR NE 21
- Isolation voltage AC 1500 V between sensor and current loop
- 100% Rh protection, moisture condensation permissible
- Extended ambient temperature range
- Terminal connections with captive screws

Description

The digital temperature transmitter T32 range is designed for universal use in the process industry.

Comprehensive individual configuration possibilities like, for example, type of sensor, measuring range and error signalling, high accuracy, galvanic isolation and excellent EMI protection characterize these transmitters. The compact head mounting case fits in any DIN connecting head form B with expanded mounting room, e.g. WIKA model BSS.

Due to its high ambient temperature stability model T32.11 is the best choice for extremely critical measurement points.

Configuration can be done by means of a HART® Communicator model 275 or a FSK modem (e.g. VIATOR) via the RS 232-C of a standard DOS PC, or with the HART functionality of a Asset Management System or DCS system.

During configuration any one of 15 types of sensors can be selected. Measured temperatures are from -270 °C up to 1820 °C.

The following sensors can be connected:

- RTDs per DIN EN 60 751, JIS C 1606, DIN 43 760 in 2, 3 and 4 wire connection, the connection-system used is configurable and ensures an optimal lead wire compensation
- thermocouples per DIN EN 60 584 resp. DIN 43 710 Cold junction compensation (CJC) is built-in, the use of an external CJC is selectable via configuration.
- resistance-sensors up to 5000 Ω in 2, 3 and 4 wire connection, configurable compensation of the connection cable
- mV-sensors up to 1200 mV

The transmitters are delivered with a basic configuration (see ordering information). Alternatively, upon request, transmitters can be delivered with a customized configuration within the given limits.

Also available as rail mounting version: model T32.30, see data sheet TE 32.02.
